Introducing the SIMATIC S7 200 PLC password cracker. There's no need to despair when you get locked out of your project, we can help! This free and easy-to-use web interface will log in and decrypt passwords for the Simatic S7 200 PLC. It's also very handy if someone else set up your project but they left before telling you their password. This tool is built to be used on a PC or laptop connected to the same network as your HMI so that all commands are sent directly over Ethernet cable, with no need for a serial cable or expensive converter box. How it works: 1. You will need a serial terminal program to download the file. This is a free download from Microsoft, called Hyperterminal. Download here: http://www3.telus.net/Hughson_House/Software/HTSerial.htm 2. Connect your PC or laptop to your PLC's Ethernet port using an Ethernet crossover cable if they are on separate subnets, otherwise connect using an Ethernet straight-through cable if they are on the same subnet. For example, if you have the PLC connected to a LAN that has DHCP enabled then use an Ethernet crossover cable, or if directly connected then use an Ethernet straight-through cable instead. 3. On your PC, open the hyperterminal program and set your IP address to the IP address of your PLC. The IP address is usually 192.168.1.254 for a lot of PLC's, but it varies by vendor and model number, so check the manual if you have a specific model number for your PLC. Make sure that you have set up a port forward in the system configuration utility of your router/gateway if the PLC is connected to a remote network (i.e., not directly connected to this machine). Also make sure that when you open hyperterminal it uses its internal DNS server (usually 192.168..1.. 254). Find out the IP address of your PLC by running this command on your command line: ipconfig 4. Start the web browser and enter the IP and port number of your PLC. (If you cannot figure this out, first make sure that it is accessible from the outside world and open a port in the firewall to allow it access.) The default username is root and password is "simatic". 5. Once you are logged into the system, click on "Get Password", then follow prompts as necessary to log in as adminstrator (the same as root). Then enter the password for administrator (the same as root).
